I have a client with multiple locations that wanted a new phone system and a network design that would fit a tight budget and have built in redundancy .

Using TelePacific's flex PRI we were able to keep the cost down and give them voice and data on the same circuit and set up a VPN using Juniper firewalls and built tunnels to each location. In the event of a failure Covad's wireless internet access was used as a redundant link. Radware's loadbalancing appliance was used to load balance between the primary and secondary links and provide automatic failover in the event of a failure. The Shoretel phone system was implemented at all locations.
